

AI Prompts Used During Development

System Prompts, Prompt Engineering Patterns, and Metaprompt Catalog

Document ID: PROMPT-CAT-v2.0 | Date: September 19, 2026 | Clinical AI Safety Engineering

1. Prompt Engineering Architecture & Safety Principles

The platform enforces strict prompt engineering principles across all conversational, triage, and consensus agents. Prompts are structured with explicit role definitions, negative constraints (forbidding speculation, diagnosis, or medication alteration), output schema boundaries, and immediate emergency exit rules.

Prompt 1: Voice Intake Conversational Agent Prompt

Role & Objective: Governs the telephone conversational agent checking on post-discharge patient recovery.

Prompt 2: Structured Clinical Triage & Indicator Extraction (Assessment A)

Role & Objective: Parses unstructured encounter dialogues into validated Pydantic models with evidence citations.

Prompt 3: Conservative Consensus Arbiter Prompt

Role & Objective: Reconciles Assessment A (generative LLM) and Assessment B (deterministic rule validator).

Prompt 4: Adversarial Prompt Injection & Jailbreak Guard

Role & Objective: Sanitizes transcripts and protects clinical decision logic from malicious user inputs.

Prompt 5: Clinical Protocol Knowledge RAG Retrieval Prompt

Role & Objective: Retrieves and contextualizes hospital-specific guidelines and emergency red-flag criteria.

**Prompt 6: Development Metaprompt for Queue Prioritization Mathematics**

Role & Objective: Used during development to formulate the continuous queue priority scoring function.
